

ECS Project Information Form

Name: Mingzhe Bao

Course: ENGR489

Supervisor: Jens Dietrich

Project Name: **Scotland Yard Multiplayer Game as Map Overlay**

Project Description: (please include a reasonable level of detail to help evaluate your risk analysis.)

Description

Scotland Yard is an asymmetric boardgame where several “detective” players try to corner and catch a “Mr X” player on a map of London. The aim of this project is to create an online version to be played using an online map overlay (Google map or similar). The map to be used is Wellington.

Detail

Challenges include: (1) programming in multiple languages (JS or TypeScript on client, some other language like Java on server although node.js could also be used here). (2) use of APIs (client map APIs, identity management) (3) HCI evaluation with peers (4) web protocols incl server to client push protocols (SSE or web sockets)

RISK ANALYSIS

Does your project contain anything that can cause serious harm or death?

e.g. building /modifying things with voltages over 60V, Chemicals, Moving machinery (e.g. Tank/Marvin) , Flying components (e.g. Phantom UAV, Plane), Bodies of water.

YES ☐ (Major)

NO ☒

If Yes

Please contact the School Safety Officer or Electronics Technicians to talk through your Safety Plan

Otherwise

Does your project contain anything that can cause **harm or Injury?**

eg building /modifying things with voltages up to 60V, Moving machinery (e.g. desktop Minions), Flying components e.g. (micro Quad rotor, Parrot AR Drone, heavy items)

YES ☐ (Medium)

NO ☒

If Yes, please Complete a Safety Plan, and send to Safety Officer

Everyone to complete.

Computers are an integral part of all projects.

Describe how you will manage computer related risks such as Occupational Over Use, Cable management, etc.

E.g. taking breaks, Keeping cables tidy and not messy, etc.

For this project, the main health and safety risks relate to extended computer use and the workspace setup. These risks will be managed by following good ergonomic and workspace practices.

To reduce the risk of occupational overuse injuries such as eye strain, wrist strain, and back pain, regular breaks will be taken while working at the computer. Short breaks will be taken every 20–30 minutes to stretch, rest the eyes, and change posture. The workstation will be set up ergonomically, with the monitor at eye level, the keyboard and mouse positioned comfortably, and the chair adjusted to support good posture.

Eye strain will be managed by following the 20-20-20 rule, where every 20 minutes the eyes are rested by looking at something about 20 feet away for 20 seconds. Screen brightness and lighting will also be adjusted to reduce glare.

Cable management will be maintained to prevent tripping hazards and accidental disconnection of equipment. Cables will be kept organised, secured where possible, and kept away from walkways. The workspace will also be kept tidy to avoid clutter around the computer equipment.

In general, maintaining a clean and organised workspace, taking regular breaks, and ensuring an ergonomic setup will minimise health and safety risks while working on the computer.

General Project information –

if in any doubt select yes.

Is your Project (it may be both.)

In-house ☐ e.g. internal school project

Industry based or have an external client ☐

In your project will you be working or testing at any industry workplace or external sites.
This includes meetings at client offices, or visits to sites.

YES ☐

NO ☒

Have you been Health and Safety inducted into the industry workplace or external sites

YES ☒

NO ☐

Does your Project use human test subjects?

YES ☒

NO ☐

Will you have Ethics Approval before you start testing?

YES ☒

NO ☐

If you have any doubts on which category your project falls into please contact the School Safety Officer, to help evaluate the safe risk.
